

Sprint Planning

(Just a suggestion on method)

A suggestion on how we should do the sprint planning:

1. Get together as a group
2. Go through all non-completed issues in the backlog
3. Assign story points to each issue (this is a number that indicates the size of the issue. It is based on how long it may take to complete, complexity of the work, uncertainty or risk associated with issue)
4. We will decide on the velocity of the sprint (how much work we can complete in a sprint eg. 20 story points)
5. Put issues of highest priority into sprint with a total of story points that equals our velocity

Once we have first sprint complete, we can sum the story points of the completed issues and compare them to our chosen velocity to give us an idea of how we are doing. We can then use this number to help us decide on the velocity of the next sprint.
